There are two reasons for me to join Tensors team. The first is to help the society by being part of the NGO work and social projects. This would give me inner satisfaction as I would be helping someone out. The other reason is to upskill myself by learning more about web development which is useful in diverse domains. I want to explore the software field something which I couldn't in the first year. Also designing web pages will help bring in creativity in me which I am fond of. And I liked the previous projects made by the team like the Decov App which would have been useful in difficult times such as COVID. And the JEE Counselling project was also a nice initiative to help the incoming students for college-branch selection. The Media Literacy Platform and the portal for extracting complaints from people is really exciting.

The Tensors Team is different from other WebOps team in a way that it directly works with NGO to solve real world problems which will create significant impact in the society. Most of the other WebOps team are more focused on building there own websites for a particular event. Few are there who work for social cause but they are not directly in touch with NGOs as Tensor Team is. The Navasahayog app was also a nice initiative as it would help the students of rural India.
